

Russian Town Quarantined Over Anthrax Outbreak

August 07, 2014

Almost 200 of the town's residents have been tested for anthrax, but only one has been diagnosed with it.

A town in the midwest Russian region of Tatarstan has been placed under quarantine after a local resident was diagnosed with anthrax.

The region's head, Rustam Minnikhanov, on Thursday declared a two-month ban on transporting animals and animal products into or out of the town of Lyuga, which is seeing the region's first anthrax case in 11 years.

Local residents are also prohibited from slaughtering livestock for consumption and from using milk produced by animals that could be infected.

The quarantine could be shortened to 15 days, provided that no further cases occur and that all safety measures have been fully observed, Minnikhanov said in a decree.

On Monday, a resident of Lyuga, 48-year-old Fanil Gabdullin, was hospitalized in the

regional capital, Kazan, and was diagnosed with cutaneous anthrax.

Although often less fatal than respiratory anthrax, the cutaneous form of the disease can be contracted through spores when handling contaminated animal products.

Tatarstan's Health Ministry said that 19 people who had been in direct contact with Gabdullin were being screened for anthrax twice daily.

Of the 190 people tested for anthrax in Lyuga, no one other than Gabdullin has been found to be afflicted with the illness.

Notably, this isn't the first anthrax scare in Russia in recent weeks. Interfax reported last month that an anthrax vaccine shipment had sunken in a Siberian river and posed a danger to the local population.

At the time, safety official Izabella Samoiloova warned that "the cargo has either drifted away or somebody has found it. The second scenario is more dangerous because opening the ampules by oneself ... can lead to various ailments."

Fortunately, the shipment was found shortly thereafter, Interfax reported.
