Consumer safety officials in the Sverdlovsk region could order stores under its jurisdiction to remove Jack Daniel's Tennessee Honey Whiskey from their shelves after inspectors said they had detected chemical substances "not common to whiskey" in consignments of the liquor, ITAR-Tass reported Monday.

"The decision to withdraw the line of alcoholic products will be made in the coming days," a spokeswoman for the regional consumer protection agency was quoted as saying by ITAR-Tass.

On Friday, the regional agency said it had uncovered problems with the contents of Jack Daniel's Tennessee Honey Liqueur, as well as the drink's more common sibling, Jack Daniel's Tennessee Whiskey.

Under Russian law, alcohol packaging should include a list of ingredients written in Russian, the location where it was brewed, and the length of the distilling process — all of which Jack Daniel's lacks, the agency said at the time.
