

Russia's HIV Rates Highest in Three Siberian Cities

July 24, 2017

The Siberian cities of Kemerovo, Novosibirsk and Irkutsk have the highest rates of HIV in Russia, according to the chief of Russia's consumer rights watchdog Rospotrebnadzor.

Anna Popova, Rospotrebnadzor head, said these regions also faced high-levels of drug use.

“There are two epidemics in Russia – drug addiction and HIV infections, and geographically they coincide,” the Rospotrebnadzor head [said](#) at a youth forum on July 23.

In September 2016, 854,187 Russians [registered](#) as living with HIV. The country's growing HIV rate differs from much of the developed world, where the number of new cases is falling. In 2015, Russian health authorities registered 95,475 new HIV cases, and another 75,962 during the first nine months of 2016.

Alexander Semyonov, head of the immunology and virology lab at the St. Petersburg Pasteur Institute [said](#) this March that the disease was increasingly being spread via sexual contact.

“Several years ago the average HIV patient was a drug user consuming two or three doses of heroin every day,” Semyonov told reporters. “These days it’s entrepreneurs, workers, housewives, students — ordinary people.”

Attempts to combat the virus in Russia have been encumbered by a lack of funding. The Finance Ministry in January this year [abandoned](#) a proposal to allocate a four-year rollout of 70 billion rubles (\$1.2 billion) to fight the country’s HIV epidemic.

The former head of the Russian Federal Drug Control Service [said](#) in 2015 that, “Attempts to impose [HIV relief] legalization in Russia are not associated with therapeutic objectives... [but rather] with the political ambitions of the global drug lobby and the economic interests of pharmaceutical companies.”
