

When Boiling Water Meets Freezing Air: Russia's Latest Instagram Trend, in Photos

February 06, 2019

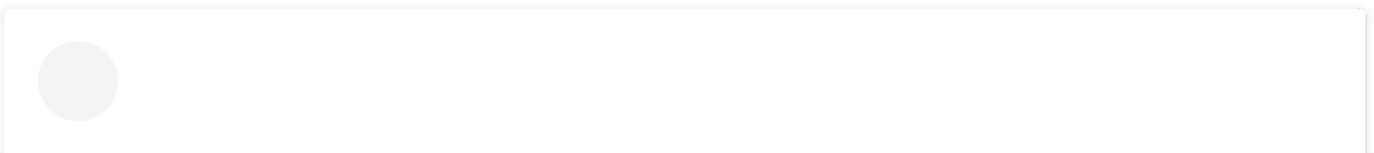

katrin22region / Instagram

A new trend has made its rounds on Russian social media in recent weeks called "The *Dubak* Challenge," (from the Russian дубак, a slang word for intense cold) in which boiling hot water is thrown into sub-zero air for a beautiful sight. The result comes from the Mpemba effect, in which hot water freezes faster than cold water.

Warning: While the effects are tempting, the process is a risky one. We strongly advise you to not try this at home.

Besides the dangerous stunt, good photography is also key to the trend.
